

# SonicWALL Managed Security Services Program

MANAGED SERVICES

**Affordable, managed security solutions featuring proven products**

- **Productivity and cost savings**
- **Predictable costs**
- **Worry-free protection and security management**
- **24x7 rapid response**

Whether in business, education, healthcare or government, organizations depend on Internet-based solutions for their critical infrastructure to better serve customers, make information more accessible, and be more competitive. Coping with the constant onslaught of increasingly sophisticated malicious attacks and the flood of vulnerabilities becomes more and more challenging. In addition, IT managers are frustrated by the multitude of independent point solutions—solutions that often lack basic integration and interoperability of standard features necessary to successfully manage an organization’s security infrastructure. Business managers are concerned with potential exposure associated with various regulatory requirements as well as the potential of negative publicity if security is not properly configured, managed and maintained.

## MSSP Program

SonicWALL®, a leading provider of layered security, productivity and mobility solutions, has equipped an exclusive group of independent partners to preempt information security related incidents by offering organizations of all sizes, affordable, managed security solutions featuring proven SonicWALL products and software.

## Features and Benefits

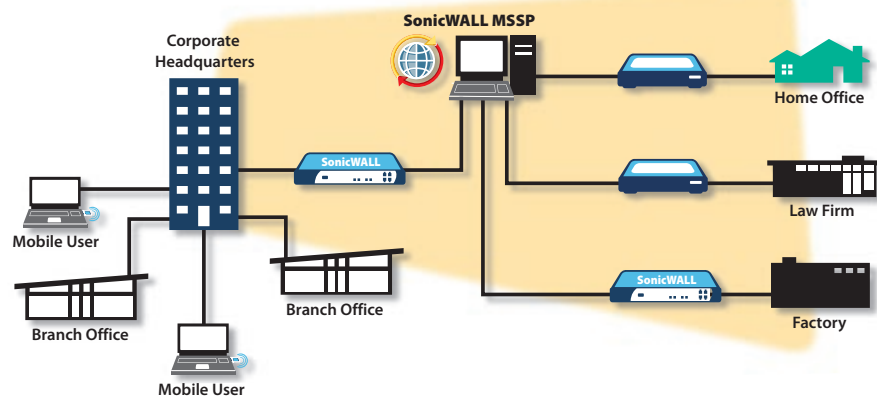

**Productivity and cost savings** – Increase in business productivity by proactively monitoring network traffic to prevent downtime, reducing internal staffing costs and freeing existing staff to focus on key activities

**Predictable costs** – Immediate cost savings are generally visible less than 90 days after engaging the MSSP. Cost structure, as well as fees, is predictable based on the selected services

**Worry-free protection** – A managed services solution provides enterprise-class protection for a fraction of the cost of equivalent internal systems

**24x7 rapid response** – Detailed reporting and monitors ensure a timely response to alerts and rapid resolution of security issues

## SonicWALL Global Management System providing a comprehensive security management solution for service providers.

## SonicWALL Managed Security Services Program Overview

### Proven business continuity

SonicWALL's TZ and PRO Series appliances are designed with integrated and automated failover and fallback capabilities to support both broadband and dial-up connectivity.

### Award-winning products

SonicWALL Global Management System (GMS) is the cornerstone of SonicWALL's MSSP offering. This scalable system provides a central management tool for small organizations, enterprises and service providers to centralize security policy management for remote SonicWALL Internet security appliances and security services.

### Gateway Anti-Virus/Intrusion Prevention Service

Gateway Anti-Virus/Intrusion Prevention Service (GAV/IPS) integrates a configurable, high performance deep packet inspection engine and dynamically updated database containing thousands of attack and vulnerability signatures to protect networks against a comprehensive array of dynamic threats including viruses, worms, Trojans, and software vulnerabilities such as buffer overflows, as well as peer-to-peer and instant messenger applications, backdoor exploits, and other malicious code.

### Expert advice

A security expert will work with you to define security policies that meet your business objectives and provide up-to-the-minute protection against worms, Trojans and malicious attacks. As new products, services or changes in your business requirements occur, the expert once again works with you to fine tune your security policies.

### Wireless security

Virtually all new laptop computers are built for wireless and ship with integrated wireless support. The business benefits of wireless networking are clear. However, with wireless connectivity, security is far more challenging as users are free to move from area to area or connect from entirely different zones.

### In-depth security

SonicWALL's layered security starts with an industry proven firewall/vpn security appliance to provide the first level of defense for your network. Security services for gateway anti-virus, intrusion prevention, desktop-enforced anti-virus and content filtering work with your firewall, adding further layers of protection.

### Independent third party evaluation

ICSA and FIPS-140-2-certifications are available throughout the entire range of SonicWALL products.

### Easy to use

Unlike desktop solutions, SonicWALL's modular architecture eliminates the hassle and expense of maintaining individual desktop security applications by centralizing these functions on your security appliance. Security policies on the firewall ensure all users are up to date with the latest protection, thereby significantly reducing organizational risk.

### Secure remote connectivity

For organizations needing to connect locations together, virtual private networks provide industry-proven security and reliability. With an IPSec VPN, organizations can share information and resources between locations as if they were all in the same building. This same technology also provides remote users with a secure connection to the organization's network.
